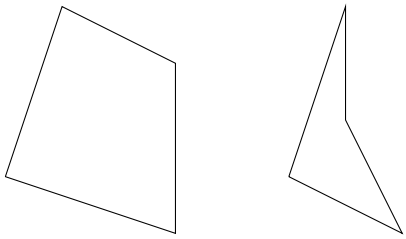
GEOMETRY (FRACTAL AND OTHERWISE)

1. A well-known geometry theorem states that the sum of the interior angles of a triangle must be 180°. This problem guides you through finding a similar formula for the sum of the interior angles of any convex polygon. Convex means that every interior angle is less than 180°, so the first quadrilateral below is convex, but the second is not.[1]



a) Determine the sum of the interior angles of a convex quadrilateral (hint: divide it into two triangles).

b) Determine the sum of the interior angles of a convex pentagon (hint: divide it into a triangle and a quadrilateral, then use your formula from part a.

c) Find a general formula for the sum of interior angles of a convex polygon with $n \geq 3$ sides, then prove that your formula always works.

Date: December 8, 2021.

[1]Technically, convex means that the straight line between any two points of the polygon is entirely inside the polygon

Definition. We construct the Cantor middle-thirds set as follows. Define the following sets (as unions of intervals in $\mathbb{R}$):

$$\begin{aligned} C_0 &= [0,1] \\ C_1 &= \left[0,\frac{1}{3}\right] \cup \left[\frac{2}{3},1\right] \\ C_2 &= \left[0,\frac{1}{9}\right] \cup \left[\frac{2}{9},\frac{1}{3}\right] \cup \left[\frac{2}{3},\frac{7}{9}\right] \cup \left[\frac{8}{9},1\right] \\ &\vdots \end{aligned}$$

In general, C_{k+1} is formed by removing the open middle third of each interval in C_k. The **Cantor middle-thirds set** is

$$\boxed{\mathcal{C} = \bigcap_{k=0}^{\infty} C_k}$$

2. Prove or disprove the following statements about $\mathcal{C}$.

a) $\mathcal{C} = \emptyset$

b) $\forall n \in \mathbb{N}, \left(0, \frac{1}{2^n}\right) \nsubseteq \mathcal{C}$

Definition. Any real number can be expressed in ternary, which is like binary but with 3 possible values for each digit. For example, the ternary number 201 is

$$\left(2 \times 3^2\right) + \left(0 \times 3^1\right) + \left(1 \times 3^0\right) = 18 + 0 + 1 = 19.$$

And the ternary number 0.201 is

$$\left(2 \times 3^{-1}\right) + \left(0 \times 3^{-2}\right) + \left(1 \times 3^{-3}\right) = \frac{2}{3} + \frac{0}{9} + \frac{1}{27} = \frac{19}{27}.$$

Proposition 1. *Let $x \in [0, 1]$. Then $x \in \mathcal{C}$ if and only if x can be written as a ternary number using* ***only*** *the digits 0 and 2.*

3. Is $1/4$ in the Cantor set?

4. Is the Cantor set countable?

Challenge. Prove proposition 1.
