<u>Lab. 4</u>

Design a circuit that 1) counts the number of times the key-3 push-button is pressed 2) display the count on the board's LCD, 3) uses the push-button key-0 to reset the system. The default value displayed on the LCD before key-3 is pressed for the first time is 0. If the number of times the key-3 push-button is pressed exceeds ten, the system should display the text:

YOU PUSHED TOO MANY TIMES

On the DE2-115 board the FPGA controls the LCD via the interface shown in figure:

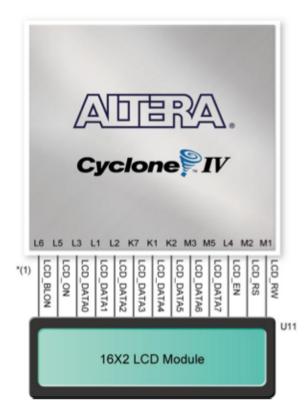

Figure 4-12 Connections between the LCD module and Cyclone IV E FPGA

\*(1): Note the current LCD modules used on DE2-115 boards do not have backlight. Therefore the LCD\_BLON signal should not be used in users' design projects.

Signal Nama	EBCA Din Mo	Description	VO
Signal Name	FPGA Pin No.	Description	Standard
LCD_DATA[7]	PIN_M5	LCD Data[7]	3.3V
LCD_DATA[6]	PIN_M3	LCD Data[6]	3.3V
LCD_DATA[5]	PIN_K2	LCD Data[5]	3.3V
LCD_DATA[4]	PIN_K1	LCD Data[4]	3.3V
LCD_DATA[3]	PIN_K7	LCD Data[3]	3.3V
LCD_DATA[2]	PIN_L2	LCD Data[2]	3.3V

LCD_BLON	PIN_L6	LCD Back Light ON/OFF	3.3V

Table 4-6 Pin Assignments for LCD Module

The 2 x 16 character LCD has a built in graphic controller.

The controller has three internal memory regions (DDRAM, CGROM, CGRAM), each with a specific purpose. The display must be initialized before accessing any of these memory regions.

The memory map, the command set of the internal controller and the operation and timing of the 8-bit Data Interface are described in the attached data sheet.

- 1. Write a short report documenting the main characteristic and performance of the system you designed (think of the document as the "data sheet" of your system)
- 2. Submit VHDL code for both design and test bench.
- 3. Submit the waveforms used for the test bench. Comment the waveforms and make sure to illustrate that the system works as expected
- 4. Analyze the synthesis and implementation reports and submit a short summary including area and timing.
- 5. Demonstrate the operation of the circuit on the prototyping board

Grading will be based on:

- A. Correctness of the design [40 pts]
- B. Coding style quality [20 pts]
- C. Effectiveness of testing [30 pts]
- D. Quality of the report [20 pts]

## 2. Precautions in use of LCD Modules

- (1) Avoid applying excessive shocks to the module or making any alterations or modifications to it.
- (2) Don't make extra holes on the printed circuit board, modify its shape or change the components of LCD module.
- (3) Don't disassemble the LCM.
- (4) Don't operate it above the absolute maximum rating.
- (5) Don't drop, bend or twist LCM.
- (6) Soldering:only to the I/O terminals.
- (7) Storage:please storage in anti-static electricity container and clean environment.

## 3. General Specification

ITEM	STANDARD VALUE	UNIT			
Number of Characters:	16 characters × 2 Lines				
Module dimension:	80.0×36.0×13.5(MAX)mm	mm			
View area:	66.0×16.0mm	mm			
Active area:	56.2×11.5mm	mm			
Character size:	(L)2.95×(W)5.55mm	mm			
Character pitch:	(L)3.55×(W)5.95mm	mm			
LCD type:	STN, Negative ,transmissive, Blue				
Duty:	1/16				
View direction:	6 o'clock				
Backlight:	LED White				

## 4. Absolute Maximum Ratings

Wave Length	λp				nm	ILED=25mA
Life Time			100000		Hr.	V≦3.6V
Color	White					

## **10.Function Description**

The LCD display Module is built in a LSI controller, the controller has two 8-bit registers, an instruction register (IR) and a data register (DR).

The IR stores instruction codes, such as display clear and cursor shift, and address information for display data RAM (DDRAM) and character generator (CGRAM). The IR can only be written from the MPU. The DR temporarily stores data to be written or read from DDRAM or CGRAM. When address information is written into the IR, then data is stored into the DR from DDRAM or CGRAM. By the register selector (RS) signal, these two registers can be selected.

RS	R/W	Operation
0	0	IR write as an internal operation (display clear, etc.)
0	1	Read busy flag (DB7) and address counter (DB0 to DB7)
1	0	Write data to DDRAM or CGRAM (DR to DDRAM or CGRAM)
1	1	Read data from DDRAM or CGRAM (DDRAM or CGRAM to DR)

### Busy Flag (BF)

When the busy flag is 1, the controller LSI is in the internal operation mode, and the next instruction will not be accepted. When RS=0 and R/W=1, the busy flag is output to DB7. The next instruction must be written after ensuring that the busy flag is 0.

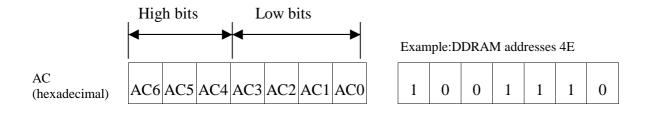

### Address Counter (AC)

The address counter (AC) assigns addresses to both DDRAM and CGRAM

### Display Data RAM (DDRAM)

This DDRAM is used to store the display data represented in 8-bit character codes. Its extended capacity is  $80 \times 8$  bits or 80 characters. Below figure is the relationships between DDRAM addresses and positions on the liquid crystal display.

### **DDRAM** Address

### Display position DDRAM address

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E	0F
40	41	42	43	44	45	46	47	48	49	4A	4B	4C	4D	4E	4F

2-Line by 16-Character Display

### **Character Generator ROM (CGROM)**

The CGROM generate  $5 \times 8$  dot or  $5 \times 10$  dot character patterns from 8-bit character codes. See Table 2.

### **Character Generator RAM (CGRAM)**

In CGRAM, the user can rewrite character by program. For  $5 \times 8$  dots, eight character patterns can be written, and for  $5 \times 10$  dots, four character patterns can be written.

Write into DDRAM the character code at the addresses shown as the left column of table 1. To show the character patterns stored in CGRAM.

Relationship between CGRAM Addresses, Character Codes (DDRAM) and Character Patterns (CGRAM Data)

### Table 1.

For 5 \* 8 dot character patterns

Character Codes (DDRAM data)	CGRAM Address	Character Patterns (CGRAM data)	
7 6 5 4 3 2 1 0	5 4 3 2 1 0	7 6 5 4 3 2 1 0

## 12.Instruction Table

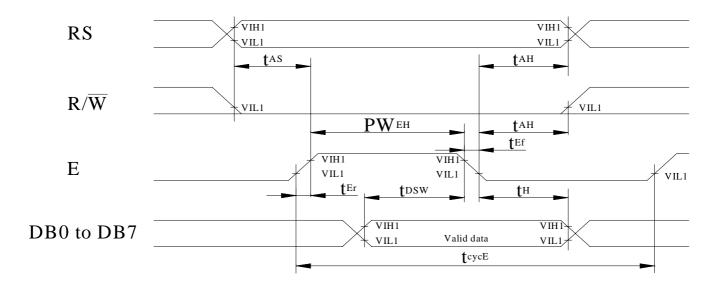

Instruction				In	struct	ion Co	ode				Description	Execution time (face 270V kg)
Instruction	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description	Execution time (fosc=270Khz)
Clear Display	0	0	0	0	0	0	0	0	0	1	Write "00H" to DDRAM and set DDRAM address to "00H" from AC	1.53ms
Return Home	0	0	0	0	0	0	0	0	1		Set DDRAM address to "00H" from AC and return cursor to its original position if shifted. The contents of DDRAM are not changed.	1.53ms
Entry Mode Set	0	0	0	0	0	0	0	1	I/D	SH	Assign cursor moving direction and enable the shift of entire display.	39 µ s
Display ON/OFF Control	0	0	0	0	0	0	1	D	С	В	Set display (D), cursor (C), and blinking of cursor (B) on/off control bit.	39 µ s
Cursor or Display Shift	0	0	0	0	0	1	S/C	R/L	_	_	Set cursor moving and display shift control bit, and the direction, without changing of DDRAM data.	39 µ s
Function Set	0	0	0	0	1	DL	N	F			Set interface data length (DL:8-bit/4-bit), numbers of display line (N:2-line/1-line)and, display font type (F:5 $\times$ 11 dots/5 $\times$ 8 dots)	39 μ s
Set CGRAM Address	0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0	Set CGRAM address in address counter.	39 µ s
Set DDRAM Address	0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Set DDRAM address in address counter.	39 µ s
Read Busy Flag and Address	0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Whether during internal operation or not can be known by reading BF. The contents of address counter can also be read.	0 µ s
Write Data to RAM	1	0	D7	D6	D5	D4	D3	D2	D1	D0	Write data into internal RAM (DDRAM/CGRAM).	43 μ s
Read Data from RAM	1	1	D7	D6	D5	D4	D3	D2	D1	D0	Read data from internal RAM (DDRAM/CGRAM).	43 μ s

\* "-" : don't care

## 13. Timing Characteristics

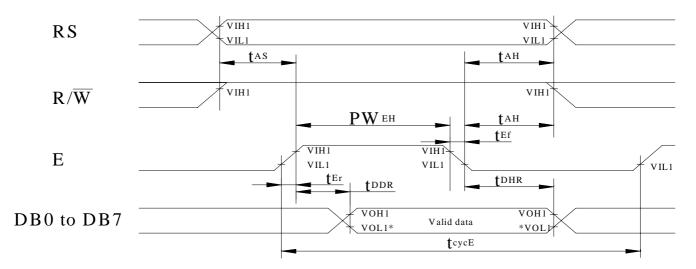

### **13.1** Write Operation

Item	Symbol	Min	Тур	Max	Unit
Enable cycle time	t <sub>cycE</sub>	500	_	_	ns
Enable pulse width (high level)	PW <sub>EH</sub>	230	_	_	ns
Enable rise/fall time	t <sub>Er</sub> ,t <sub>Ef</sub>		_	20	ns
Address set-up time (RS, R/W to E)	t <sub>AS</sub>	40			ns
Address hold time	t <sub>AH</sub>	10		_	ns
Data set-up time	t <sub>DSW</sub>	80		_	ns
Data hold time	t <sub>H</sub>	10	_	_	ns

### 13.2 Read Operation

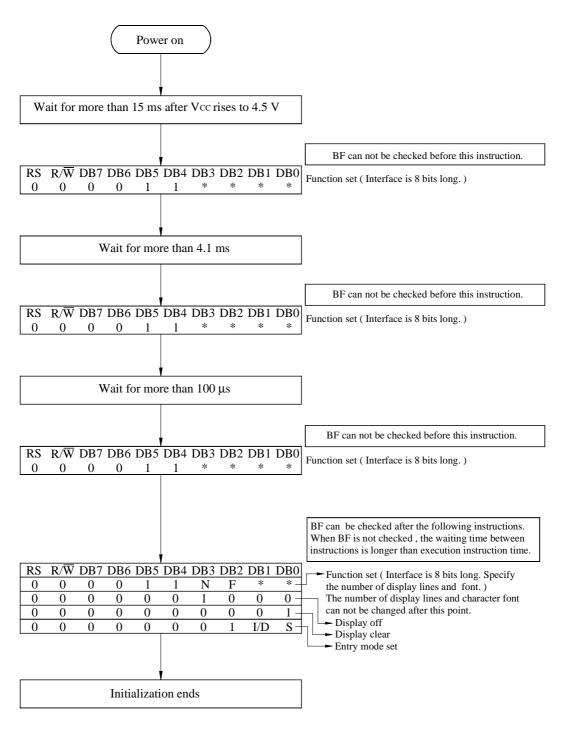

NOTE: \*VOL1 is assumed to be 0.8V at 2 MHZ operation.

ITEM	Symbol	Min	Тур	Max	Unit
Enable cycle time	t <sub>cycE</sub>	500	_	_	ns
Enable pulse width (high level)	$\mathrm{PW}_{\mathrm{EH}}$	230			ns
Enable rise/fall time	t <sub>Er</sub> ,t <sub>Ef</sub>	_	_	20	ns
Address set-up time (RS, R/W to E)	t <sub>AS</sub>	40			ns
Address hold time	t <sub>AH</sub>	10			ns
Data delay time	t <sub>DDR</sub>			160	ns
Data hold time	t <sub>DHR</sub>	5			ns

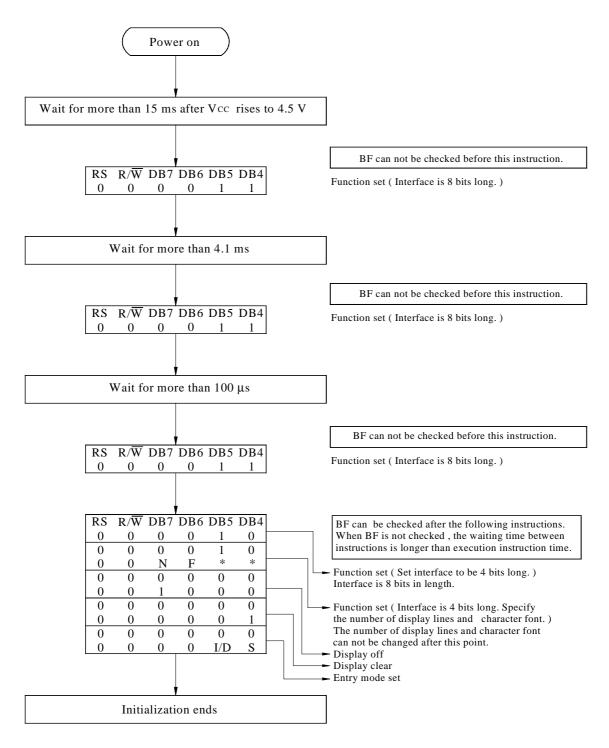

## 14. Initializing of LCM

8-Bit Ineterface

4-Bit Ineterface

## 15. Quality Assurance

### ◆ Screen Cosmetic Criteria

No.	Defect	udgement Criterion	Partition	
		A)Clear		
		Size:d mm Acce	ptable Qty in active area	
		d $\leq 0.1$	Disregard	
		$0.1 < d \le 0.2$	6	
		$0.2 < d \le 0.3$	2	
		0.3 <d< td=""><td>0</td><td></td></d<>	0	
1	Spots	Note:Including pin holes	and defective dots which must be within one pixel size.	Minor
		3)Unclear		
		Size:d mm Acce	eptable Qty in active area	
		d $\leq 0.2$	Disregard	
		$0.2 < d \le 0.5$	6	
		$0.5 < d \le 0.7$	2	
		0.7 <d< td=""><td>0</td><td></td></d<>	0	
		Size:d mm Acce	eptable Qty in active area	
		$d{\leq}0.3$	Disregard

## HD44780U (LCD-II)

### (Dot Matrix Liquid Crystal Display Controller/Driver)

## HITACHI

### Description

The HD44780U dot-matrix liquid crystal display controller and driver LSI displays alphanumerics, Japanese kana characters, and symbols. It can be configured to drive a dot-matrix liquid crystal display under the control of a 4- or 8-bit microprocessor. Since all the functions such as display RAM, character generator, and liquid crystal driver, required for driving a dot-matrix liquid crystal display are internally provided on one chip, a minimal system can be interfaced with this controller/driver.

A single HD44780U can display up to one 8-character line or two 8-character lines.

The HD44780U has pin function compatibility with the HD44780S which allows the user to easily replace an LCD-II with an HD44780U. The HD44780U character generator ROM is extended to generate 208  $5 \times 8$  dot character fonts and  $325 \times 10$  dot character fonts for a total of 240 different character fonts.

The low power supply (2.7V to 5.5V) of the HD44780U is suitable for any portable battery-driven product requiring low power dissipation.

### Features

- $5 \times 8$  and  $5 \times 10$  dot matrix possible
- Low power operation support:
  - 2.7 to 5.5V
- Wide range of liquid crystal display driver power
  - 3.0 to 11V
- Liquid crystal drive waveform
  - A (One line frequency AC waveform)
- Correspond to high speed MPU bus interface
  - -2 MHz (when  $V_{cc} = 5V$ )
- 4-bit or 8-bit MPU interface enabled
- 80 × 8-bit display RAM (80 characters max.)
- 9,920-bit character generator ROM for a total of 240 character fonts
  - 208 character fonts ( $5 \times 8$  dot)
  - 32 character fonts (5  $\times$  10 dot)

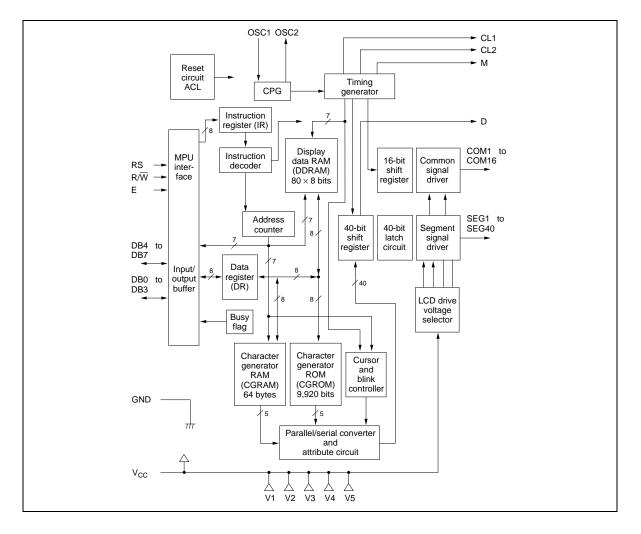

- $64 \times 8$ -bit character generator RAM
  - 8 character fonts (5 × 8 dot)
  - 4 character fonts ( $5 \times 10$  dot)
- 16-common × 40-segment liquid crystal display driver
- Programmable duty cycles
  - 1/8 for one line of  $5 \times 8$  dots with cursor
  - 1/11 for one line of  $5 \times 10$  dots with cursor
  - 1/16 for two lines of  $5 \times 8$  dots with cursor
- Wide range of instruction functions:
  - Display clear, cursor home, display on/off, cursor on/off, display character blink, cursor shift, display shift
- Pin function compatibility with HD44780S
- Automatic reset circuit that initializes the controller/driver after power on
- Internal oscillator with external resistors
- Low power consumption

### **Pin Functions**

Signal	No. of Lines	I/O	Device Interfaced with	Function
RS	1	I	MPU	<ul> <li>Selects registers.</li> <li>0: Instruction register (for write) Busy flag: address counter (for read)</li> <li>1: Data register (for write and read)</li> </ul>
R/W	1	I	MPU	Selects read or write. 0: Write 1: Read
E	1	Ι	MPU	Starts data read/write.
DB4 to DB7	4	I/O	MPU	Four high order bidirectional tristate data bus pins. Used for data transfer and receive between the MPU and the HD44780U. DB7 can be used as a busy flag.
DB0 to DB3	4	I/O	MPU	Four low order bidirectional tristate data bus pins. Used for data transfer and receive between the MPU and the HD44780U. These pins are not used during 4-bit operation.
CL1	1	0	Extension driver	Clock to latch serial data D sent to the extension driver
CL2	1	0	Extension driver	Clock to shift serial data D
М	1	0	Extension driver	Switch signal for converting the liquid crystal drive waveform to AC
D	1	0	Extension driver	Character pattern data corresponding to each segment signal
COM1 to COM16	16	0	LCD	Common signals that are not used are changed to non-selection waveforms. COM9 to COM16 are non-selection waveforms at 1/8 duty factor and COM12 to COM16 are non-selection waveforms at 1/11 duty factor.
SEG1 to SEG40	40	0	LCD	Segment signals
V1 to V5	5	—	Power supply	Power supply for LCD drive $V_{cc}$ -V5 = 11 V (max)
V <sub>cc</sub> , GND	2	—	Power supply	V <sub>cc</sub> : 2.7V to 5.5V, GND: 0V
OSC1, OSC2	2	_	Oscillation resistor clock	When crystal oscillation is performed, a resistor must be connected externally. When the pin input is an external clock, it must be input to OSC1.

### **Function Description**

### Registers

The HD44780U has two 8-bit registers, an instruction register (IR) and a data register (DR).

The IR stores instruction codes, such as display clear and cursor shift, and address information for display data RAM (DDRAM) and character generator RAM (CGRAM). The IR can only be written from the MPU.

The DR temporarily stores data to be written into DDRAM or CGRAM and temporarily stores data to be read from DDRAM or CGRAM. Data written into the DR from the MPU is automatically written into DDRAM or CGRAM by an internal operation. The DR is also used for data storage when reading data from DDRAM or CGRAM. When address information is written into the IR, data is read and then stored into the DR from DDRAM or CGRAM by an internal operation. Data transfer between the MPU is then completed when the MPU reads the DR. After the read, data in DDRAM or CGRAM at the next address is sent to the DR for the next read from the MPU. By the register selector (RS) signal, these two registers can be selected (Table 1).

### **Busy Flag (BF)**

When the busy flag is 1, the HD44780U is in the internal operation mode, and the next instruction will not be accepted. When RS = 0 and  $R/\overline{W} = 1$  (Table 1), the busy flag is output to DB7. The next instruction must be written after ensuring that the busy flag is 0.

### Address Counter (AC)

The address counter (AC) assigns addresses to both DDRAM and CGRAM. When an address of an instruction is written into the IR, the address information is sent from the IR to the AC. Selection of either DDRAM or CGRAM is also determined concurrently by the instruction.

After writing into (reading from) DDRAM or CGRAM, the AC is automatically incremented by 1 (decremented by 1). The AC contents are then output to DB0 to DB6 when RS = 0 and  $R/\overline{W} = 1$  (Table 1).

RS	R/W	Operation
0	0	IR write as an internal operation (display clear, etc.)
0	1	Read busy flag (DB7) and address counter (DB0 to DB6)
1	0	DR write as an internal operation (DR to DDRAM or CGRAM)
1	1	DR read as an internal operation (DDRAM or CGRAM to DR)

### HITACHI

#### **Display Data RAM (DDRAM)**

Display data RAM (DDRAM) stores display data represented in 8-bit character codes. Its extended capacity is  $80 \times 8$  bits, or 80 characters. The area in display data RAM (DDRAM) that is not used for display can be used as general data RAM. See Figure 1 for the relationships between DDRAM addresses and positions on the liquid crystal display.

The DDRAM address  $(A_{DD})$  is set in the address counter (AC) as hexadecimal.

- 1-line display (N = 0) (Figure 2)
  - When there are fewer than 80 display characters, the display begins at the head position. For example, if using only the HD44780, 8 characters are displayed. See Figure 3.

When the display shift operation is performed, the DDRAM address shifts. See Figure 3.

	High order	Low bi		Exan	nple:	DDR	AM a	addre	ss 4	E	
AC (hexadecimal)	AC6 AC5 AC4	AC3 AC2	AC1 AC0	1	0	0	1	1	1	0	

### Figure 1 DDRAM Address

Display positio (digit)	n 1	2	3	4	5	79	80
DDRAM address	00	01	02	03	04	 4E	4F
(hexadecimal)							

Figure 2 1-Line Display

Display position DDRAM address	00 01 02 03 04 05 06 07
For shift left	01 02 03 04 05 06 07 08
For shift righ	$_{t}$ 4F 00 01 02 03 04 05 06

Figure 3 1-Line by 8-Character Display Example

- 2-line display (N = 1) (Figure 4)
  - Case 1: When the number of display characters is less than 40 × 2 lines, the two lines are displayed from the head. Note that the first line end address and the second line start address are not consecutive. For example, when just the HD44780 is used, 8 characters × 2 lines are displayed. See Figure 5.

When display shift operation is performed, the DDRAM address shifts. See Figure 5.

Display position	_1	2	3	4	5	 39	40
DDRAM	00	01	02	03	04	 26	27
address (hexadecimal)	40	41	42	43	44	 66	67

Figure 4 2-Line Display

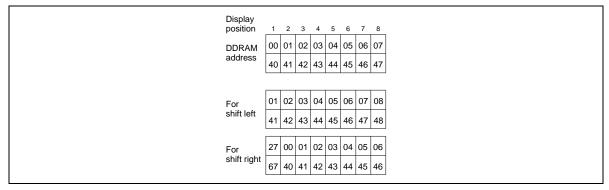

Figure 5 2-Line by 8-Character Display Example

 Case 2: For a 16-character × 2-line display, the HD44780 can be extended using one 40-output extension driver. See Figure 6.

When display shift operation is performed, the DDRAM address shifts. See Figure 6.

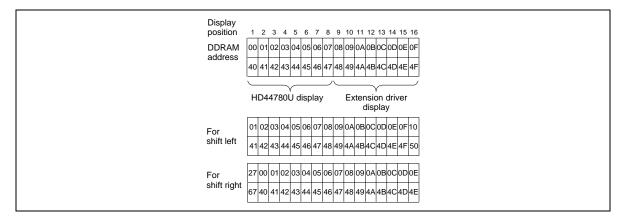

Figure 6 2-Line by 16-Character Display Example

#### **Character Generator ROM (CGROM)**

The character generator ROM generates  $5 \times 8$  dot or  $5 \times 10$  dot character patterns from 8-bit character codes (Table 4). It can generate 208  $5 \times 8$  dot character patterns and 32  $5 \times 10$  dot character patterns. User-defined character patterns are also available by mask-programmed ROM.

### **Character Generator RAM (CGRAM)**

In the character generator RAM, the user can rewrite character patterns by program. For  $5 \times 8$  dots, eight character patterns can be written, and for  $5 \times 10$  dots, four character patterns can be written.

Write into DDRAM the character codes at the addresses shown as the left column of Table 4 to show the character patterns stored in CGRAM.

See Table 5 for the relationship between CGRAM addresses and data and display patterns.

Areas that are not used for display can be used as general data RAM.

#### **Modifying Character Patterns**

• Character pattern development procedure

The following operations correspond to the numbers listed in Figure 7:

- 1. Determine the correspondence between character codes and character patterns.
- 2. Create a listing indicating the correspondence between EPROM addresses and data.
- 3. Program the character patterns into the EPROM.
- 4. Send the EPROM to Hitachi.
- 5. Computer processing on the EPROM is performed at Hitachi to create a character pattern listing, which is sent to the user.
- 6. If there are no problems within the character pattern listing, a trial LSI is created at Hitachi and samples are sent to the user for evaluation. When it is confirmed by the user that the character patterns are correctly written, mass production of the LSI proceeds at Hitachi.

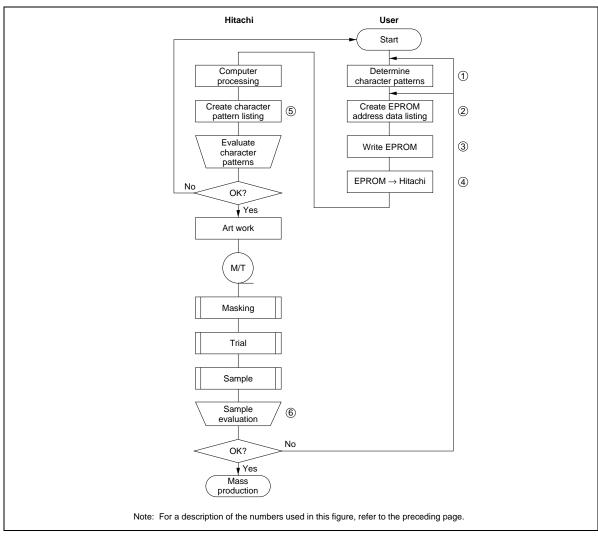

Figure 7 Character Pattern Development Procedure

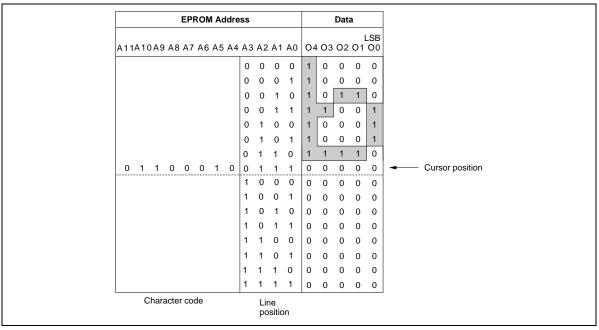

• Programming character patterns

This section explains the correspondence between addresses and data used to program character patterns in EPROM. The HD44780U character generator ROM can generate 208  $5 \times 8$  dot character patterns and  $325 \times 10$  dot character patterns for a total of 240 different character patterns.

— Character patterns

EPROM address data and character pattern data correspond with each other to form a  $5 \times 8$  or  $5 \times 10$  dot character pattern (Tables 2 and 3).

Table 2Example of Correspondence between EPROM Address Data and Character Pattern<br/>(5 × 8 Dots)

Notes: 1. EPROM addresses A11 to A4 correspond to a character code.

- 2. EPROM addresses A3 to A0 specify a line position of the character pattern.
- 3. EPROM data O4 to O0 correspond to character pattern data.
- 4. EPROM data O5 to O7 must be specified as 0.
- 5. A lit display position (black) corresponds to a 1.
- 6. Line 9 and the following lines must be blanked with 0s for a  $5 \times 8$  dot character fonts.

- Handling unused character patterns
  - 1. EPROM data outside the character pattern area: Always input 0s.
  - 2. EPROM data in CGRAM area: Always input 0s. (Input 0s to EPROM addresses 00H to FFH.)

3. EPROM data used when the user does not use any HD44780U character pattern: According to the user application, handled in one of the two ways listed as follows.

- a. When unused character patterns are not programmed: If an unused character code is written into DDRAM, all its dots are lit. By not programing a character pattern, all of its bits become lit. (This is due to the EPROM being filled with 1s after it is erased.)
- b. When unused character patterns are programmed as 0s: Nothing is displayed even if unused character codes are written into DDRAM. (This is equivalent to a space.)

## Table 3Example of Correspondence between EPROM Address Data and Character Pattern<br/>(5 × 10 Dots)

	0 0 0 0 * 0 0 1	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	0         1         0         1         0           1         1         1         1         1         1           0         0         1         0         0         1         0         0           1         1         1         1         1         1         1         1         0         0         1         0	Character
	0 0 0 0 * 1 1 1		* * *	]

Notes: 1. Character code bits 0 to 2 correspond to CGRAM address bits 3 to 5 (3 bits: 8 types).

 CGRAM address bits 0 to 2 designate the character pattern line position. The 8th line is the cursor position and its display is formed by a logical OR with the cursor. Maintain the 8th line data, corresponding to the cursor display position, at 0 as the cursor display.

If the 8th line data is 1, 1 bits will light up the 8th line regardless of the cursor presence.

- 3. Character pattern row positions correspond to CGRAM data bits 0 to 4 (bit 4 being at the left).
- 4. As shown Table 5, CGRAM character patterns are selected when character code bits 4 to 7 are all 0. However, since character code bit 3 has no effect, the R display example above can be selected by either character code 00H or 08H.

5. 1 for CGRAM data corresponds to display selection and 0 to non-selection.

\* Indicates no effect.

## Table 5Relationship between CGRAM Addresses, Character Codes (DDRAM) and Character<br/>Patterns (CGRAM Data) (cont)

Character Codes (DDRAM data)	CGRAM Address	Character Patterns (CGRAM data)	
7 6 5 4 3 2 1 0	5 4 3 2 1 0	7 6 5 4 3 2 1 0	
High Low	High Low	High Low	
	0 0 0 0	* * * 0 0 0 0 0	]
	0 0 0 1	0000	
	0 0 1 0	1 0 1 1 0	
	0 0 1 1		
	0 1 0 0		Character pattern
0 0 0 0 * 0 0 *	0 0 0 1 0 1		pattern
	0 1 1 0		
	1 0 0 0		
	1 0 0 1		
	1010	* * * 0 0 0 0 0	Cursor position
	1011	* * * * * * * *	,
	1 1 0 0		
	1 1 0 1		
	1 1 1 0	* *	
	1 1 1 1	* * * * * * *	
	0 0 0 0	* * *	
	0001		
0000*11*	1 1 1 0 0 1		
0000.11.		* * *	
	1 0 1 1	* * * ! * * * * *	
	1 1 0 0		
	1 1 0 1		
	1 1 1 0		
	1 1 1 1	* * * * * * * *	

Notes: 1. Character code bits 1 and 2 correspond to CGRAM address bits 4 and 5 (2 bits: 4 types).

2. CGRAM address bits 0 to 3 designate the character pattern line position. The 11th line is the cursor position and its display is formed by a logical OR with the cursor.

Maintain the 11th line data corresponding to the cursor display positon at 0 as the cursor display.

If the 11th line data is "1", "1" bits will light up the 11th line regardless of the cursor presence. Since lines 12 to 16 are not used for display, they can be used for general data RAM.

- 3. Character pattern row positions are the same as  $5 \times 8$  dot character pattern positions.
- CGRAM character patterns are selected when character code bits 4 to 7 are all 0. However, since character code bits 0 and 3 have no effect, the P display example above can be selected by character codes 00H, 01H, 08H, and 09H.
- 5. 1 for CGRAM data corresponds to display selection and 0 to non-selection.
- \* Indicates no effect.

#### **Timing Generation Circuit**

The timing generation circuit generates timing signals for the operation of internal circuits such as DDRAM, CGROM and CGRAM. RAM read timing for display and internal operation timing by MPU access are generated separately to avoid interfering with each other. Therefore, when writing data to DDRAM, for example, there will be no undesirable interferences, such as flickering, in areas other than the display area.

#### Liquid Crystal Display Driver Circuit

The liquid crystal display driver circuit consists of 16 common signal drivers and 40 segment signal drivers. When the character font and number of lines are selected by a program, the required common signal drivers automatically output drive waveforms, while the other common signal drivers continue to output non-selection waveforms.

Sending serial data always starts at the display data character pattern corresponding to the last address of the display data RAM (DDRAM).

Since serial data is latched when the display data character pattern corresponding to the starting address enters the internal shift register, the HD44780U drives from the head display.

#### **Cursor/Blink Control Circuit**

The cursor/blink control circuit generates the cursor or character blinking. The cursor or the blinking will appear with the digit located at the display data RAM (DDRAM) address set in the address counter (AC).

For example (Figure 8), when the address counter is 08H, the cursor position is displayed at DDRAM address 08H.

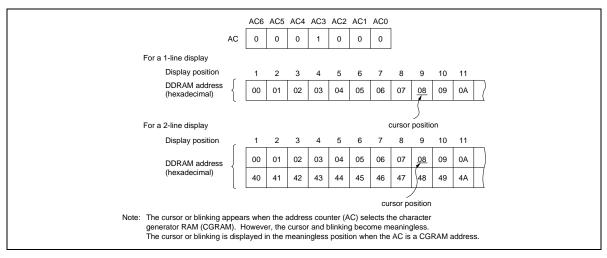

Figure 8 Cursor/Blink Display Example

#### HITACHI

#### **Interfacing to the MPU**

The HD44780U can send data in either two 4-bit operations or one 8-bit operation, thus allowing interfacing with 4- or 8-bit MPUs.

• For 4-bit interface data, only four bus lines (DB4 to DB7) are used for transfer. Bus lines DB0 to DB3 are disabled. The data transfer between the HD44780U and the MPU is completed after the 4-bit data has been transferred twice. As for the order of data transfer, the four high order bits (for 8-bit operation, DB4 to DB7) are transferred before the four low order bits (for 8-bit operation, DB0 to DB3).

The busy flag must be checked (one instruction) after the 4-bit data has been transferred twice. Two more 4-bit operations then transfer the busy flag and address counter data.

• For 8-bit interface data, all eight bus lines (DB0 to DB7) are used.

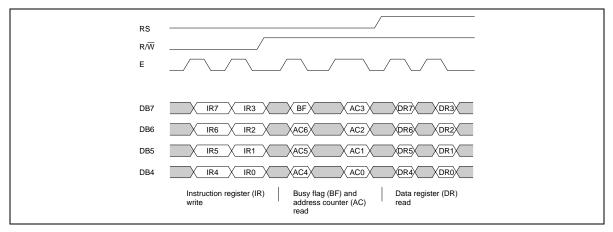

Figure 9 4-Bit Transfer Example

#### **Reset Function**

#### **Initializing by Internal Reset Circuit**

An internal reset circuit automatically initializes the HD44780U when the power is turned on. The following instructions are executed during the initialization. The busy flag (BF) is kept in the busy state until the initialization ends (BF = 1). The busy state lasts for 10 ms after  $V_{cc}$  rises to 4.5 V.

- 1. Display clear
- 2. Function set:

DL = 1; 8-bit interface data

- N = 0; 1-line display
- F = 0; 5 × 8 dot character font
- 3. Display on/off control:
  - D = 0; Display off
  - C = 0; Cursor off
  - B = 0; Blinking off
- 4. Entry mode set:

I/D = 1; Increment by 1

- S = 0; No shift
- Note: If the electrical characteristics conditions listed under the table Power Supply Conditions Using Internal Reset Circuit are not met, the internal reset circuit will not operate normally and will fail to initialize the HD44780U. For such a case, initial-ization must be performed by the MPU as explained in the section, Initializing by Instruction.

#### Instructions

#### Outline

Only the instruction register (IR) and the data register (DR) of the HD44780U can be controlled by the MPU. Before starting the internal operation of the HD44780U, control information is temporarily stored into these registers to allow interfacing with various MPUs, which operate at different speeds, or various peripheral control devices. The internal operation of the HD44780U is determined by signals sent from the MPU. These signals, which include register selection signal (RS), read/

write signal ( $R/\overline{W}$ ), and the data bus (DB0 to DB7), make up the HD44780U instructions (Table 6). There are four categories of instructions that:

- Designate HD44780U functions, such as display format, data length, etc.
- Set internal RAM addresses
- Perform data transfer with internal RAM
- Perform miscellaneous functions

Normally, instructions that perform data transfer with internal RAM are used the most. However, autoincrementation by 1 (or auto-decrementation by 1) of internal HD44780U RAM addresses after each data write can lighten the program load of the MPU. Since the display shift instruction (Table 11) can perform concurrently with display data write, the user can minimize system development time with maximum programming efficiency.

When an instruction is being executed for internal operation, no instruction other than the busy flag/address read instruction can be executed.

Because the busy flag is set to 1 while an instruction is being executed, check it to make sure it is 0 before sending another instruction from the MPU.

Note: Be sure the HD44780U is not in the busy state (BF = 0) before sending an instruction from the MPU to the HD44780U. If an instruction is sent without checking the busy flag, the time between the first instruction and next instruction will take much longer than the instruction time itself. Refer to Table 6 for the list of each instruction execution time.

					Co	ode						Execution Time (max) (when $f_{cp}$ or
Instruction	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description	f <sub>osc</sub> is 270 kHz)
Clear display	0	0	0	0	0	0	0	0	0	1	Clears entire display and sets DDRAM address 0 in address counter.	
Return home	0	0	0	0	0	0	0	0	1	_	Sets DDRAM address 0 in address counter. Also returns display from being shifted to original position. DDRAM contents remain unchanged.	1.52 ms
Entry mode set	0	0	0	0	0	0	0	1	I/D	S	Sets cursor move direction and specifies display shift. These operations are performed during data write and read.	37 µs
Display on/off control	0	0	0	0	0	0	1	D	С	В	Sets entire display (D) on/off, cursor on/off (C), and blinking of cursor position character (B).	37 µs
Cursor or display shift	0	0	0	0	0	1	S/C	R/L	_	—	Moves cursor and shifts display without changing DDRAM contents.	37 µs
Function set	0	0	0	0	1	DL	N	F	_	—	Sets interface data length (DL), number of display lines (N), and character font (F).	37 µs
Set CGRAM address	0	0	0	1	ACG	ACG	ACG	ACG	ACG	ACG	Sets CGRAM address. CGRAM data is sent and received after this setting.	37 µs
Set DDRAM address	0	0	1	ADD	ADD	ADD	ADD	ADD	ADD	ADD	Sets DDRAM address. DDRAM data is sent and received after this setting.	37 µs
Read busy flag & address	0	1	BF	AC	Reads busy flag (BF) indicating internal operation is being performed and reads address counter contents.	0 µs						

#### Table 6Instructions

#### Table 6Instructions (cont)

			с	ode							Execution Time (max) (when f <sub>cp</sub> or
Instruction	RS	R/W	DB7 DB6 DB5	DB4	DB3	DB2	DB1	DB0	Descripti	ion	f <sub>osc</sub> is 270 kHz)
Write data to CG or DDRAM	1	0	Write data						Writes da CGRAM.	ta into DDRAM or	37 µs $t_{ADD} = 4 µs^*$
Read data from CG or DDRAM	1	1	Read data						Reads da CGRAM.	ta from DDRAM or	37 µs $t_{ADD} = 4 µs^*$
	S/C R/L	= 1: = 0: = 1: = 0: = 1:	Internally operat	bits line 0:5× ing	8 dot	6			CGRAM: ACG: ADD: (corr addr AC: Add both	Display data RAM Character generator RAM CGRAM address DDRAM address responds to cursor ress) ress counter used for DD and CGRAM resses	Execution time changes when frequency changes Example: When $f_{ep}$ or $f_{OSC}$ is 250 kHz, $37 \mu s \times \frac{270}{250} = 40 \mu s$

Note: — indicates no effect.

\* After execution of the CGRAM/DDRAM data write or read instruction, the RAM address counter is incremented or decremented by 1. The RAM address counter is updated after the busy flag turns off. In Figure 10, t<sub>ADD</sub> is the time elapsed after the busy flag turns off until the address counter is updated.

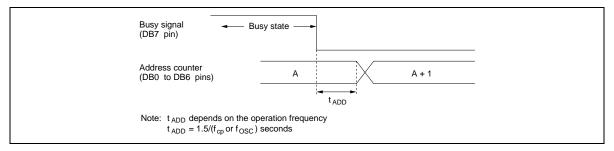

Figure 10 Address Counter Update

#### **Instruction Description**

#### **Clear Display**

Clear display writes space code 20H (character pattern for character code 20H must be a blank pattern) into all DDRAM addresses. It then sets DDRAM address 0 into the address counter, and returns the display to its original status if it was shifted. In other words, the display disappears and the cursor or blinking goes to the left edge of the display (in the first line if 2 lines are displayed). It also sets I/D to 1 (increment mode) in entry mode. S of entry mode does not change.

#### **Return Home**

Return home sets DDRAM address 0 into the address counter, and returns the display to its original status if it was shifted. The DDRAM contents do not change.

The cursor or blinking go to the left edge of the display (in the first line if 2 lines are displayed).

#### **Entry Mode Set**

**I/D:** Increments (I/D = 1) or decrements (I/D = 0) the DDRAM address by 1 when a character code is written into or read from DDRAM.

The cursor or blinking moves to the right when incremented by 1 and to the left when decremented by 1. The same applies to writing and reading of CGRAM.

S: Shifts the entire display either to the right (I/D = 0) or to the left (I/D = 1) when S is 1. The display does not shift if S is 0.

If S is 1, it will seem as if the cursor does not move but the display does. The display does not shift when reading from DDRAM. Also, writing into or reading out from CGRAM does not shift the display.

#### **Display On/Off Control**

**D**: The display is on when D is 1 and off when D is 0. When off, the display data remains in DDRAM, but can be displayed instantly by setting D to 1.

**C:** The cursor is displayed when C is 1 and not displayed when C is 0. Even if the cursor disappears, the function of I/D or other specifications will not change during display data write. The cursor is displayed using 5 dots in the 8th line for  $5 \times 8$  dot character font selection and in the 11th line for the  $5 \times 10$  dot character font selection (Figure 13).

**B:** The character indicated by the cursor blinks when B is 1 (Figure 13). The blinking is displayed as switching between all blank dots and displayed characters at a speed of 409.6-ms intervals when  $f_{cp}$  or  $f_{osc}$  is 250 kHz. The cursor and blinking can be set to display simultaneously. (The blinking frequency changes according to  $f_{osc}$  or the reciprocal of  $f_{cp}$ . For example, when  $f_{cp}$  is 270 kHz, 409.6 × 250/270 = 379.2 ms.)

#### HITACHI

#### Cursor or Display Shift

Cursor or display shift shifts the cursor position or display to the right or left without writing or reading display data (Table 7). This function is used to correct or search the display. In a 2-line display, the cursor moves to the second line when it passes the 40th digit of the first line. Note that the first and second line displays will shift at the same time.

When the displayed data is shifted repeatedly each line moves only horizontally. The second line display does not shift into the first line position.

The address counter (AC) contents will not change if the only action performed is a display shift.

#### **Function Set**

**DL:** Sets the interface data length. Data is sent or received in 8-bit lengths (DB7 to DB0) when DL is 1, and in 4-bit lengths (DB7 to DB4) when DL is 0.When 4-bit length is selected, data must be sent or received twice.

N: Sets the number of display lines.

**F:** Sets the character font.

Note: Perform the function at the head of the program before executing any instructions (except for the read busy flag and address instruction). From this point, the function set instruction cannot be executed unless the interface data length is changed.

#### Set CGRAM Address

Set CGRAM address sets the CGRAM address binary AAAAAA into the address counter.

Data is then written to or read from the MPU for CGRAM.

RS R/W DB7 DB6 DB5 DB	34 DB3 DB2 DB1 DB0
Clear Code 0 0 0 0 0 0	0 0 0 1
RS R/W DB7 DB6 DB5 DB	34 DB3 DB2 DB1 DB0
Return Code 0 0 0 0 0 0	0         0         0         1         Note: * Don't care.
RS R/W DB7 DB6 DB5 DB	34 DB3 DB2 DB1 DB0
Entry mode set         Code         0         0         0         0         0         0	0 0 0 1
RS R/₩ DB7 DB6 DB5 DB	34 DB3 DB2 DB1 DB0
Display on/off control Code 0 0 0 0 0 0	0 0 0 1

#### Figure 11

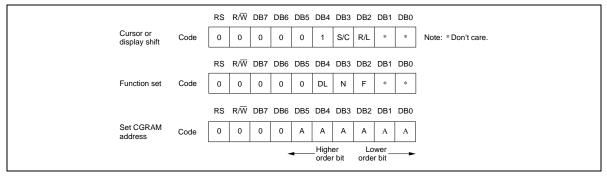

Figure 12

#### Set DDRAM Address

Set DDRAM address sets the DDRAM address binary AAAAAAA into the address counter.

Data is then written to or read from the MPU for DDRAM.

However, when N is 0 (1-line display), AAAAAAA can be 00H to 4FH. When N is 1 (2-line display), AAAAAAA can be 00H to 27H for the first line, and 40H to 67H for the second line.

#### **Read Busy Flag and Address**

Read busy flag and address reads the busy flag (BF) indicating that the system is now internally operating on a previously received instruction. If BF is 1, the internal operation is in progress. The next instruction will not be accepted until BF is reset to 0. Check the BF status before the next write operation. At the same time, the value of the address counter in binary AAAAAAA is read out. This address counter is used by both CG and DDRAM addresses, and its value is determined by the previous instruction. The address contents are the same as for instructions set CGRAM address and set DDRAM address.

#### Table 7Shift Function

#### S/C R/L

0	0	Shifts the cursor position to the left. (AC is decremented by one.)	
0	1	Shifts the cursor position to the right. (AC is incremented by one.)	
1	0	Shifts the entire display to the left. The cursor follows the display shift.	
1	1	Shifts the entire display to the right. The cursor follows the display shift.	

#### Table 8Function Set

N	F	No. of Display Lines	Character Font	Duty Factor	Remarks
0	0	1	$5 \times 8 \text{ dots}$	1/8	
0	1	1	$5 \times 10 \text{ dots}$	1/11	
1	*	2	$5 \times 8 \text{ dots}$	1/16	Cannot display two lines for $5 \times 10$ dot character font

Note: \* Indicates don't care.

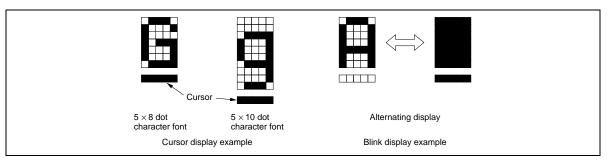

Figure 13 Cursor and Blinking

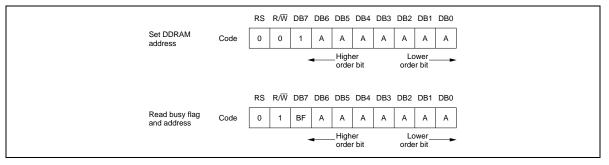

Figure 14

#### Write Data to CG or DDRAM

Write data to CG or DDRAM writes 8-bit binary data DDDDDDDD to CG or DDRAM.

To write into CG or DDRAM is determined by the previous specification of the CGRAM or DDRAM address setting. After a write, the address is automatically incremented or decremented by 1 according to the entry mode. The entry mode also determines the display shift.

#### Read Data from CG or DDRAM

Read data from CG or DDRAM reads 8-bit binary data DDDDDDDD from CG or DDRAM.

The previous designation determines whether CG or DDRAM is to be read. Before entering this read instruction, either CGRAM or DDRAM address set instruction must be executed. If not executed, the first read data will be invalid. When serially executing read instructions, the next address data is normally read from the second read. The address set instructions need not be executed just before this read instruction when shifting the cursor by the cursor shift instruction (when reading out DDRAM). The operation of the cursor shift instruction is the same as the set DDRAM address instruction.

After a read, the entry mode automatically increases or decreases the address by 1. However, display shift is not executed regardless of the entry mode.

Note: The address counter (AC) is automatically incremented or decremented by 1 after the write instructions to CGRAM or DDRAM are executed. The RAM data selected by the AC cannot be read out at this time even if read instructions are executed. Therefore, to correctly read data, execute either the address set instruction or cursor shift instruction (only with DDRAM), then just before reading the desired data, execute the read instruction from the second time the read instruction is sent.

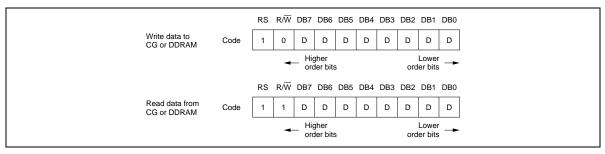

Figure 15

### **Interfacing the HD44780U**

#### Interface to MPUs

• Interfacing to an 8-bit MPU

See Figure 17 for an example of using a I/O port (for a single-chip microcomputer) as an interface device.

In this example, P30 to P37 are connected to the data bus DB0 to DB7, and P75 to P77 are connected to E,  $R/\overline{W}$ , and RS, respectively.

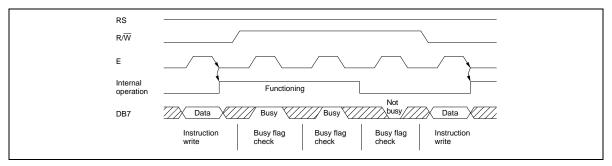

Figure 16 Example of Busy Flag Check Timing Sequence

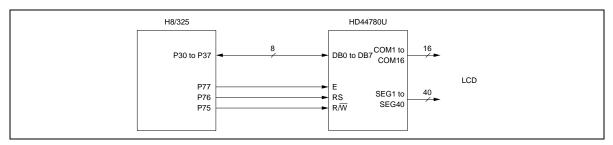

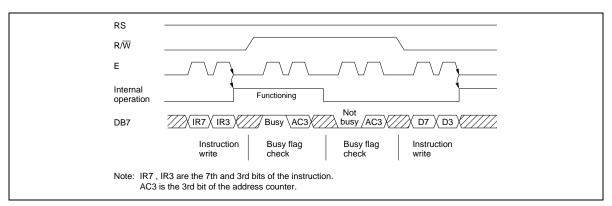

Figure 17 H8/325 Interface (Single-Chip Mode)

• Interfacing to a 4-bit MPU

The HD44780U can be connected to the I/O port of a 4-bit MPU. If the I/O port has enough bits, 8-bit data can be transferred. Otherwise, one data transfer must be made in two operations for 4-bit data. In this case, the timing sequence becomes somewhat complex. (See Figure 18.)

See Figure 19 for an interface example to the HMCS4019R.

Note that two cycles are needed for the busy flag check as well as for the data transfer. The 4-bit operation is selected by the program.

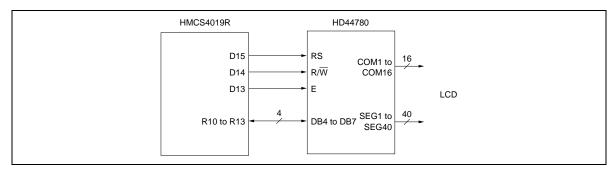

Figure 19 Example of Interface to HMCS4019R

#### **Interface to Liquid Crystal Display**

**Character Font and Number of Lines:** The HD44780U can perform two types of displays,  $5 \times 8$  dot and  $5 \times 10$  dot character fonts, each with a cursor.

Up to two lines are displayed for  $5 \times 8$  dots and one line for  $5 \times 10$  dots. Therefore, a total of three

types of common signals are available (Table 9).

The number of lines and font types can be selected by the program. (See Table 6, Instructions.)

Connection to HD44780 and Liquid Crystal Display: See Figure 20 for the connection examples.

#### Table 9Common Signals

Number of Lines	Character Font	Number of Common Signals	Duty Factor
1	$5 \times 8$ dots + cursor	8	1/8
1	$5 \times 10$ dots + cursor	11	1/11
2	$5 \times 8$ dots + cursor	16	1/16

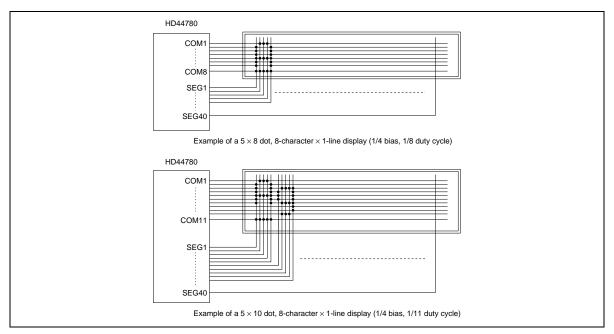

Figure 20 Liquid Crystal Display and HD44780 Connections

Since five segment signal lines can display one digit, one HD44780U can display up to 8 digits for a 1-line display and 16 digits for a 2-line display.

The examples in Figure 20 have unused common signal pins, which always output non-selection waveforms. When the liquid crystal display panel has unused extra scanning lines, connect the extra scanning lines to these common signal pins to avoid any undesirable effects due to crosstalk during the floating state (Figure 21).

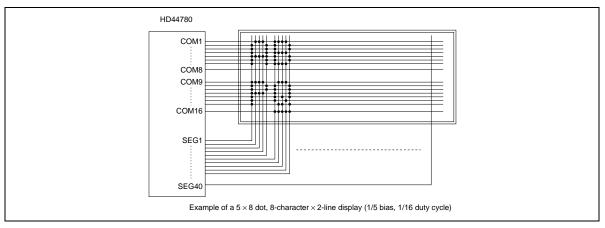

Figure 20 Liquid Crystal Display and HD44780 Connections (cont)

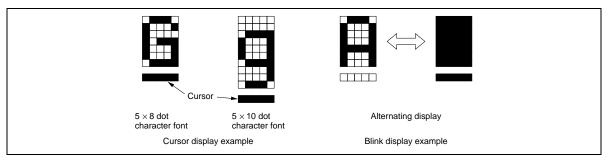

Figure 21 Using COM9 to Avoid Crosstalk on Unneeded Scanning Line

**Connection of Changed Matrix Layout:** In the preceding examples, the number of lines correspond to the scanning lines. However, the following display examples (Figure 22) are made possible by altering the matrix layout of the liquid crystal display panel. In either case, the only change is the layout. The display characteristics and the number of liquid crystal display characters depend on the number of common signals or on duty factor. Note that the display data RAM (DDRAM) addresses for 4 characters  $\times$  2 lines and for 16 characters  $\times$  1 line are the same as in Figure 20.

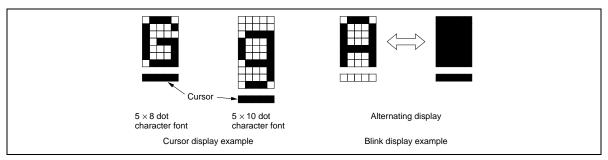

Figure 22 Changed Matrix Layout Displays

#### Power Supply for Liquid Crystal Display Drive

Various voltage levels must be applied to pins V1 to V5 of the HD44780U to obtain the liquid crystal display drive waveforms. The voltages must be changed according to the duty factor (Table 10).

VLCD is the peak value for the liquid crystal display drive waveforms, and resistance dividing provides voltages V1 to V5 (Figure 23).

		Duty Factor	
	1/8, 1/11	1/16	
		Bias	
Power Supply	1/4	1/5	
V1	V <sub>cc</sub> -1/4 VLCD	V <sub>cc</sub> -1/5 VLCD	
V2	V <sub>cc</sub> -1/2 VLCD	V <sub>cc</sub> -2/5 VLCD	
V3	V <sub>cc</sub> -1/2 VLCD	V <sub>cc</sub> –3/5 VLCD	
V4	V <sub>cc</sub> -3/4 VLCD	V <sub>cc</sub> -4/5 VLCD	
V5	V <sub>cc</sub> -VLCD	V <sub>cc</sub> –VLCD	

 Table 10
 Duty Factor and Power Supply for Liquid Crystal Display Drive

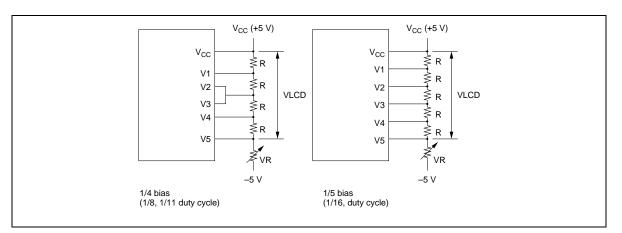

Figure 23 Drive Voltage Supply Example

# Relationship between Oscillation Frequency and Liquid Crystal Display Frame Frequency

The liquid crystal display frame frequencies of Figure 24 apply only when the oscillation frequency is 270 kHz (one clock pulse of  $3.7 \ \mu$ s).

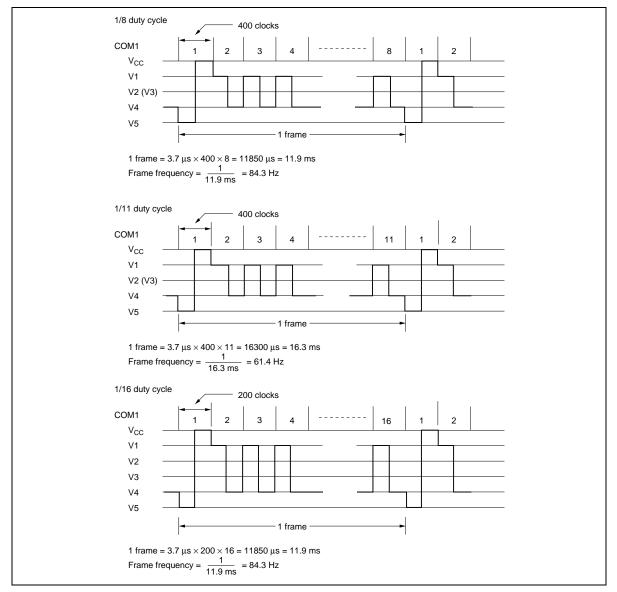

Figure 24 Frame Frequency

#### **Instruction and Display Correspondence**

• 8-bit operation, 8-digit × 1-line display with internal reset

Refer to Table 11 for an example of an 8-digit  $\times$  1-line display in 8-bit operation. The HD44780U functions must be set by the function set instruction prior to the display. Since the display data RAM can store data for 80 characters, as explained before, the RAM can be used for displays such as for advertising when combined with the display shift operation.

Since the display shift operation changes only the display position with DDRAM contents unchanged, the first display data entered into DDRAM can be output when the return home operation is performed.

• 4-bit operation, 8-digit × 1-line display with internal reset

The program must set all functions prior to the 4-bit operation (Table 12). When the power is turned on, 8-bit operation is automatically selected and the first write is performed as an 8-bit operation. Since DB0 to DB3 are not connected, a rewrite is then required. However, since one operation is completed in two accesses for 4-bit operation, a rewrite is needed to set the functions (see Table 12). Thus, DB4 to DB7 of the function set instruction is written twice.

• 8-bit operation, 8-digit × 2-line display

For a 2-line display, the cursor automatically moves from the first to the second line after the 40th digit of the first line has been written. Thus, if there are only 8 characters in the first line, the DDRAM address must be again set after the 8th character is completed. (See Table 13.) Note that the display shift operation is performed for the first and second lines. In the example of Table 13, the display shift is performed when the cursor is on the second line. However, if the shift operation is performed when the first line, both the first and second lines move together. If the shift is repeated, the display of the second line will not move to the first line. The same display will only shift within its own line for the number of times the shift is repeated.

Note: When using the internal reset, the electrical characteristics in the Power Supply Conditions Using Internal Reset Circuit table must be satisfied. If not, the HD44780U must be initialized by instructions. See the section, Initializing by Instruction.

Step					Instr	uction						
No.	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Display	Operation

#### Table 13 8-Bit Operation, 8-Digit × 2-Line Display Example with Internal Reset (cont)

#### **Initializing by Instruction**

If the power supply conditions for correctly operating the internal reset circuit are not met, initialization by instructions becomes necessary.

Refer to Figures 25 and 26 for the procedures on 8-bit and 4-bit initializations, respectively.

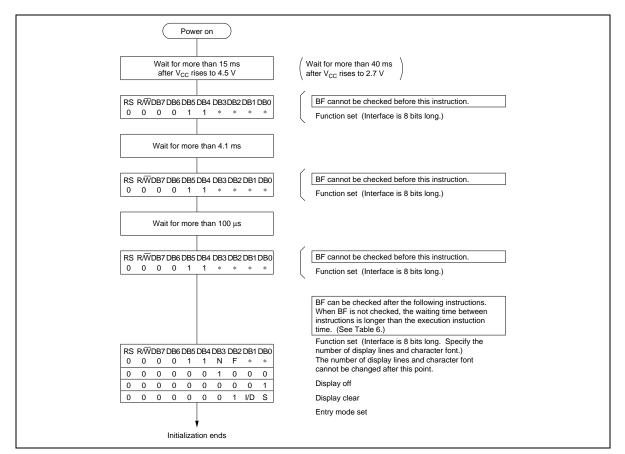

Figure 25 8-Bit Interface

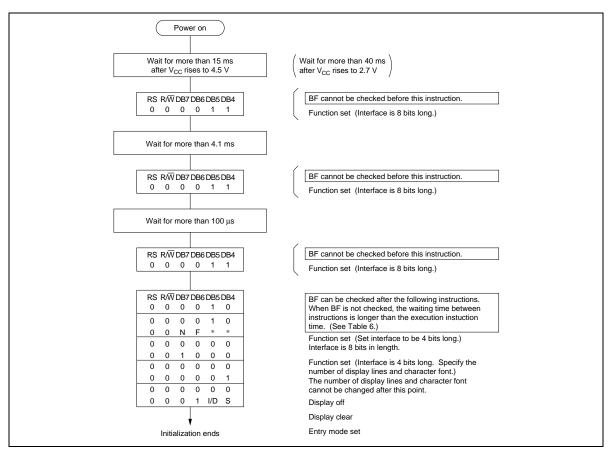

Figure 26 4-Bit Interface

### **Absolute Maximum Ratings\***

Item	Symbol	Value	Unit	Notes
Power supply voltage (1)	V <sub>cc</sub> –GND	-0.3 to +7.0	V	1
Power supply voltage (2)	V <sub>cc</sub> –V5	-0.3 to +13.0	V	1, 2
Input voltage	Vt	–0.3 to V $_{\rm cc}$ +0.3	V	1
Operating temperature	T <sub>opr</sub>	-20 to +75	°C	
Storage temperature	T <sub>stg</sub>	-55 to +125	°C	4

Note: \* If the LSI is used above these absolute maximum ratings, it may become permanently damaged. Using the LSI within the following electrical characteristic limits is strongly recommended for normal operation. If these electrical characteristic conditions are also exceeded, the LSI will malfunction and cause poor reliability.

#### **Electrical Characteristics Notes**

1. All voltage values are referred to GND = 0 V.

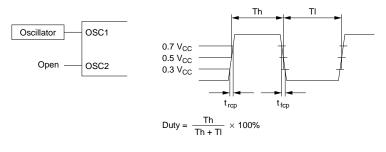

- 2.  $V_{cc} \ge V1 \ge V2 \ge V3 \ge V4 \ge V5$  must be maintained.
- 3. For die products, specified up to 75°C.
- 4. For die products, specified by the die shipment specification.
- 5. The following four circuits are I/O pin configurations except for liquid crystal display output.

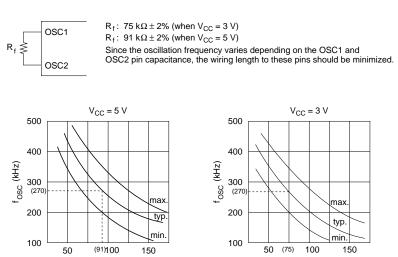

## HD44780U

- 6. Applies to input pins and I/O pins, excluding the OSC1 pin.
- 7. Applies to I/O pins.
- 8. Applies to output pins.
- 9. Current flowing through pull-up MOSs, excluding output drive MOSs.
- 10. Input/output current is excluded. When input is at an intermediate level with CMOS, the excessive current flows through the input circuit to the power supply. To avoid this from happening, the input level must be fixed high or low.
- 11. Applies only to external clock operation.

12. Applies only to the internal oscillator operation using oscillation resistor R<sub>r</sub>.

 $R_f (k\Omega)$ 

 $R_f (k\Omega)$ 

13. RCOM is the resistance between the power supply pins (V<sub>cc</sub>, V1, V4, V5) and each common signal pin (COM1 to COM16).

RSEG is the resistance between the power supply pins ( $V_{cc}$ , V2, V3, V5) and each segment signal pin (SEG1 to SEG40).

14. The following graphs show the relationship between operation frequency and current consumption.

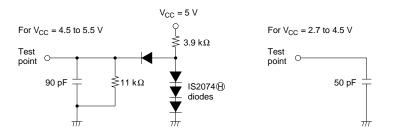

- 15. Applies to the OSC1 pin.
- 16. Each COM and SEG output voltage is within  $\pm 0.15$  V of the LCD voltage (V<sub>cc</sub>, V1, V2, V3, V4, V5) when there is no load.

#### INTRODUCTION

KS0066U is a dot matrix LCD driver & controller LSI which is fabricated by low power CMOS technology. It can display 1or 2 lines with the  $5\times8$  dots format or 1 line with the  $5\times11$  dots format.

#### **FUNCTIONS**

- · Character type dot matrix LCD driver & controller.
- Internal driver: 16 common and 40 segment signal output.
- Easy interface with 4-bit or 8-bit MPU.
- Display character pattern: 5×8 dots format (208 kinds) & 5×11 dots format (32 kinds).
- The Special character pattern is directly programmable by the Character Generator RAM.
- A customer character pattern is programmable by mask option.
- Programmable Driving Method by the same character font mask option: Display Waveform A-type and B-type
- It can drive a maximum at 80 characters by using the KS0065B or KS0063B externally.
- Various instruction functions.
- Built-in automatic power on reset.

#### FEATURES

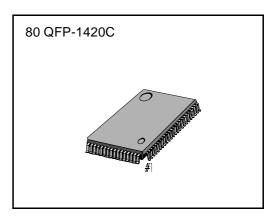

- Internal Memory
  - Character Generator ROM (CGROM): 10,080 bits (204 characters×5×8 dots) & (32 characters×5×11 dots)
  - Character Generator RAM (CGRAM): 64×8 bits (8 characters×5×8 dots)
  - Display Data RAM (DDRAM): 80×8 bits (80 characters max.)
- Low power operation
  - Power supply voltage range (VDD): 2.7 to 5.5 V
  - LCD Drive voltage range (VDD-V5): 3.0 to 13.0 V
- CMOS process

SAMSUNG

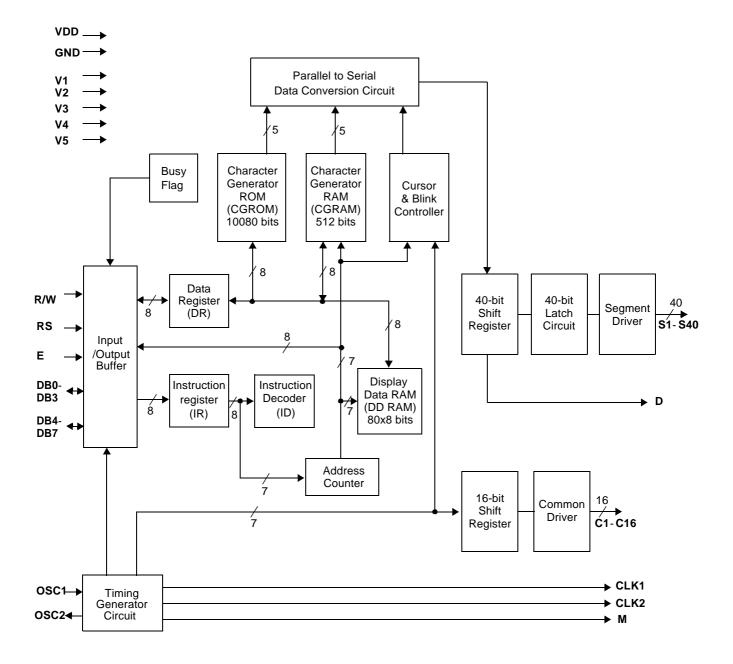

ELECTRONICS

- Programmable duty cycle: 1/8, 1/11, 1/16
- · Internal oscillator with external resistor
- Low power consumption
- 80 QFP or bare chip available

DB4-DB7	43-46	MPU			

#### **FUNCTION DESCRIPTION**

#### **System Interface**

This chip has both kinds of interface type with MPU: 4-bit bus and 8-bit bus. 4-bit bus and 8-bit bus are selected by the DL bit in the instruction register.

During read or write operation, two 8-bit registers are used. One is the data register (DR), and the other is the instruction register (IR).

The data register (DR) is used as a temporary data storage place for being written into or read from DDRAM/CGRAM. The target RAM is selected by RAM address setting instruction. Each internal operation, reading from or writing into RAM, is done automatically. Thus, after MPU reads DR data, the data in the next DDRAM/CGRAM address is transferred into DR automatically. Also, after MPU writes data to DR, the data in DR is transferred into DDRAM/CGRAM automatically.

The Instruction register(IR) is used only to store instruction codes transferred from MPU. MPU cannot use it to read instruction data.

To select a register, you can use RS input pin in 4-bit/8-bit bus mode.

RS	R/W	Operation
L	L	Instruction Write operation (MPU writes Instruction code into IR)
L	Н	Read Busy flag(DB7) and address counter (DB0 to DB6)
Н	L	Data Write operation (MPU writes data into DR)
Н	Н	Data Read operation (MPU reads data from DR)

#### Table 3. Various kinds of Operations according to RS and R/W bits

#### Busy Flag (BF)

BF = 'High'', indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted. BF can be read through DB7 port when RS = 'Low'' and R/W = 'High'' (Read Instruction Operation). Before executing the next instruction, be sure that BF is not 'High''.

#### Address Counter (AC)

The address Counter (AC) stores DDRAM/CGRAM addresses, transferred from IR. After writing into (reading from) DDRAM/CGRAM, AC is automatically increased (decreased) by 1. When RS = 'Low' and R/W = 'High', AC can be read through ports DB0 to DB6.

#### **Display Data RAM (DDRAM)**

DDRAM stores display data of maximum 80×8 bits (80 characters). DDRAM address is set in the address counter(AC) as a hexadecimal number (Refer to Fig-1.)

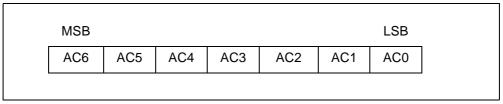

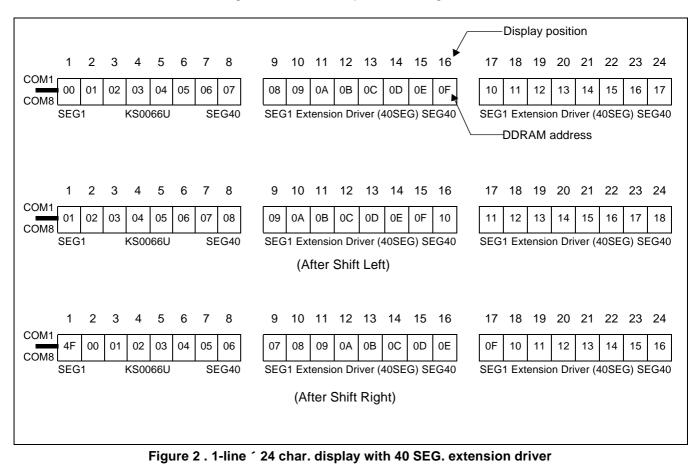

Figure 1 . DDRAM Address

1) 1-line display

In case of 1-line display, the address range of DDRAM is 00H–4FH. An extension driver will be used. Fig-2 shows the example with 40 segment extension driver added.

#### 2) 2-line display

In case of 2-line display, the address range of DDRAM is 00H–27H and 40H–67H. An extension driver will be used. Fig-3 shows the example with 40 segment extension driver added.

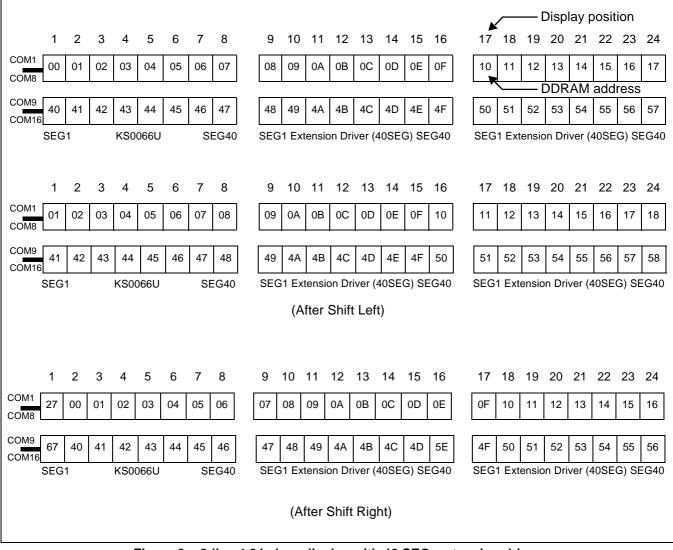

Figure 3 . 2-line  $\checkmark$  24 char. display with 40 SEG. extension driver

#### CGROM(Character Generator ROM)

CGROM has a 5×8 dots 204 characters pattern and a 5×11 dots 32 characters pattern (Refer to Table 4). CGROM has 204 character patterns of  $5\times 8$  dots, and 32 character patterns of  $5\times 11$  dots.

#### CGRAM(Character Generator RAM)

CGRAM has up to 5×8 dots 8 characters. By writing font data to CGRAM, user defined characters can be used (Refer to Table 5)

#### **Timing Generation Circuit**

Timing generation circuit generates clock signals for the internal operations.

#### **LCD Driver Circuit**

LCD Driver circuit has 16 common and 40 segment signals for LCD driving.

Data from CGRAM/CGROM is transferred to a 40-bit segment latch serially, and then is stored to 40-bit shift latch. When each common is selected by 16-bit common register, segment data is also output through segment driver from a 40-bit segment latch.

In case of 1-line display mode, COM1 to COM8 have 1/8 duty or COM1 to COM11 have 1/11 duty, and in 2-line mode, COM1 to COM16 have a 1/16 duty ratio.

#### **Cursor/Blink Control Circuit**

It controls the cursor/blink ON/OFF at cursor position.

#### Table 5. Relationship between Character Code (DDRAM) and Character Pattern (CGRAM)

#### INSTRUCTION DESCRIPTION

#### Outline

To overcome the speed difference between the internal clock of KS0066U and the MPU clock, KS0066U performs internal operations by storing control informations to IR or DR. The internal operation is determined according to the signal from MPU, composed of read/write and data bus (Refer to Table 7). Instructions can be divided largely into four groups:

- 1) KS0066U function set instructions (set display methods, set data length, etc.)
- 2) address set instructions to internal RAM
- 3) data transfer instructions with internal RAM
- 4) others

The address of the internal RAM is automatically increased or decreased by 1.

Note: During internal operation, Busy Flag (DB7) is read 'High'.

Busy Flag check must be preceded by the next instruction.

When an MPU program with checking the Busy Flag (DB7) is made, it must be necessary 1/2 fosc for executing the next instruction by the falling edge of the 'E' signal after the Busy Flag (DB7) goes to 'Low'.

#### Contents

1) Clear Display

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Clear all the display data by writing '20H" (space code) to all DDRAM address,

and set DDRAM address to '00H" into AC (address counter).

Return cursor to the original status, namely, bring the cursor to the left edge on the first line of the display. Make the entry mode increment (I/D ='High').

#### 2) Return Home

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	-
* "- " dont care									

Return Home is cursor return home instruction.

Set DDRAM address to '00H" into the address counter.

Return cursor to its original site and return display to its original status, if shifted. Contents of DDRAM does not change.

#### 3) Entry Mode Set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	SH

Set the moving direction of cursor and display.

#### I/D: Increment / decrement of DDRAM address (cursor or blink)

When I/D = 'High", cursor/blink moves to right and DDRAM address is increased by 1. When I/D = 'Low", cursor/blink moves to left and DDRAM address is decreased by 1. \* CGRAM operates the same way as DDRAM, when reading from or writing to CGRAM.

#### SH: Shift of entire display

When DDRAM read (CGRAM read/write) operation or SH = 'Low', shifting of entire display is not performed. If SH = 'High" and DDRAM write operation, shift of entire display is performed according to I/D value (I/D = 'High'' shift left, I/D = 'Low'' shift right).

4) Display ON/OFF Control

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	С	В

Control display/cursor/blink ON/OFF 1 bit register.

#### D: Display ON/OFF control bit

When D = 'High'', entire display is turned on.

When D = 'Low'', display is turned off, but display data remains in DDRAM.

#### C: Cursor ON/OFF control bit

When C = "High", cursor is turned on.

When C = 'Low'', cursor is disappeared in current display, but I/D register preserves its data.

#### **B: Cursor Blink ON/OFF control bit**

When B = 'High', cursor blink is on, which performs alternately between all the 'High' data and display characters at the cursor position.

When B = 'Low'', blink is off.

5) Cursor or Display Shift

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	-	-

Shifting of right/left cursor position or display without writing or reading of display data. This instruction is used to correct or search display data.(Refer to Table 6)

During 2-line mode display, cursor moves to the 2nd line after the 40th digit of the 1st line.

Note that display shift is performed simultaneously in all the lines.

When displayed data is shifted repeatedly, each line is shifted individually.

When display shift is performed, the contents of the address counter are not changed.

#### Table 6. Shift Patterns According to S/C and R/L Bits

S/C	R/L	Operation
0	0	Shift cursor to the left, AC is decreased by 1
0	1	Shift cursor to the right, AC is increased by 1
1	0	Shift all the display to the left, cursor moves according to the display
1	1	Shift all the display to the right, cursor moves according to the display

6) Function Set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	Ν	F	-	-

#### DL: Interface data length control bit

When DL = 'High", it means 8-bit bus mode with MPU.

When DL = 'Low", it means 4-bit bus mode with MPU. Hence, DL is a signal to select 8-bit or 4-bit bus mode. When 4-bit bus mode, it needs to transfer 4-bit data twice.

#### N: Display line number control bit

When N = 'Low', 1-line display mode is set. When N = 'High', 2-line display mode is set.

#### F: Display font type control bit

When F = 'Low', 5  $\times$ 8 dots format display mode is set. When F = 'High', 5  $\times$ 11 dots format display mode.

#### 7) Set CGRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

#### 8) Set DDRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

When 1-line display mode (N = Low), DDRAM address is from '00H" to "4FH".

In 2-line display mode (N = High), DDRAM address in the 1st line is from '00H" to '27H", and DDRAM address in the 2nd line is from '40H" to '67H".

9) Read Busy Flag & Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0

This instruction shows whether KS0066U is in internal operation or not.

If the resultant BF is 'High', internal operation is in progress and should wait until BF is to be Low, which by then the next instruction can be performed. In this instruction you can also read the value of the address counter.

10) Write data to RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to DDRAM/CGRAM.

The selection of RAM from DDRAM, and CGRAM, is set by the previous address set instruction (DRAM address set, CGRAM address set).

RAM set instruction can also determine the AC direction to RAM.

After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

#### 11) Read data from RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM.

The selection of RAM is set by the previous address set instruction. If the address set instruction of RAM is not performed before this instruction, the data that has been read first is invalid, as the direction of AC is not Yet determined. If RAM data is read several times without RAM address instructions set before read operation, the correct RAM data can be obtained from the second. But the first data would be incorrect, as there is no time margin to transfer RAM data.

In case of DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction, it also transfers RAM data to output data register.

After read operation, address counter is automatically increased/decreased by 1 according to the entry mode. After CGRAM read operation, display shift may not be executed correctly.

NOTE: In case of RAM write operation, AC is increased/decreased by 1 as in read operation.

At this time, AC indicates the next address position, but only the previous data can be read by the read instruction.

### Table 7. Instruction Table

Instruction				Inst	ructi	on C	ode				Description	Execution
Instruction	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description	time (fosc= 270 kHz)
Clear Display	0	0	0	0	0	0	0	0	0	1	Write '20H" to DDRAM and set DDRAM address to '00H" from AC	1.53 ms
Return Home	0	0	0	0	0	0	0	0	1	-	Set DDRAM address to '00H" from AC and return cursor to its original position if shifted. The contents of DDRAM are not changed.	1.53 ms
Entry Mode Set	0	0	0	0	0	0	0	1	I/D	SH	Assign cursor moving direction and enable the shift of entire display.	39 µs
Display ON/ OFF Control	0	0	0	0	0	0	1	D	С	в	Set display(D), cursor(C), and blinking of cursor(B) on/off control bit.	39 µs
Cursor or Display Shift	0	0	0	0	0	1	S/C	R/L	-	-	Set cursor moving and display shift control bit, and the direction, without changing of DDRAM data.	39 µs
Function Set	0	0	0	0	1	DL	N	F	-	-	Set interface data length (DL: 8-bit/4-bit), numbers of display line (N: 2-line/1-line) and, display font type (F:5×11dots/5×8 dots)	39 µs
Set CGRAM Address	0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0	Set CGRAM address in address counter.	39 µs
Set DDRAM Address	0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Set DDRAM address in address counter.	39 µs
Read Busy Flag and Address	0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Whether during internal operation or not can be known by reading BF. The contents of address counter can also be read.	0 µs
Write Data to RAM	1	0	D7	D6	D5	D4	D3	D2	D1	D0	Write data into internal RAM (DDRAM/CGRAM).	43 μs
Read Data from RAM	1	1	D7	D6	D5	D4	D3	D2	D1	D0	Read data from internal RAM (DDRAM/CGRAM).	43 μs

\* "-": dont care

NOTE: When an MPU program with checking the Busy Flag(DB7) is made, it must be necessary 1/2Fosc is necessary for executing the next instruction by the falling edge of the 'E' signal after the Busy Flag (DB7) goes to 'Low'.

### INTERFACE WITH MPU

#### 1) Interface with 8-bit MPU

When interfacing data length are 8-bit, transfer is performed at a time through 8 ports, from DB0 to DB7. Example of timing sequence is shown below.

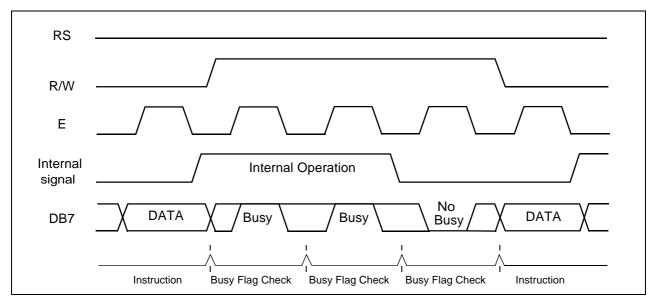

Figure 4 . Example of 8-bit Bus Mode Timing Diagram

#### 2) Interface with 4-bit MPU

When interfacing data length are 4-bit, only 4 ports, from DB4 to DB7, are used as data bus. At First, the higher 4-bit (in case of 8-bit bus mode, the contents of DB4 - DB7), and then the lower 4-bit (in case of 8-bit bus mode, the contents of DB0 - DB3) are transferred. So transfer is performed twice Busy Flag outputs 'High'' after the second transfer is ended.

Example of timing sequence is shown below.

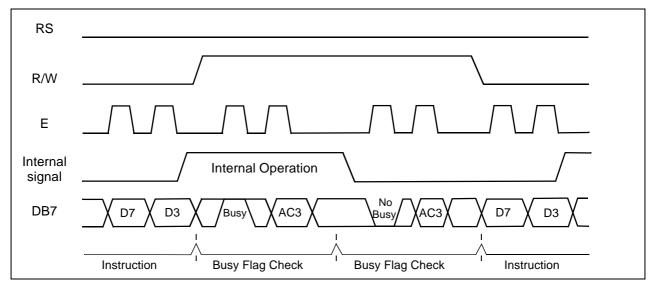

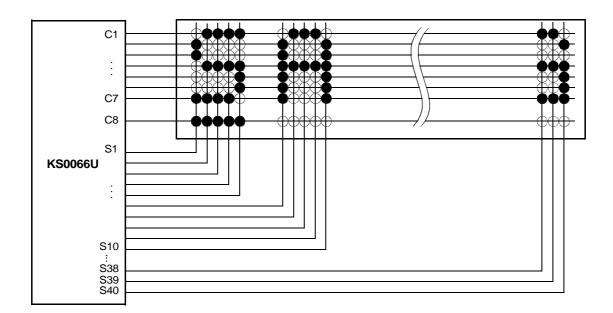

Figure 5 . Example of 4-bit Bus Mode Timing Diagram

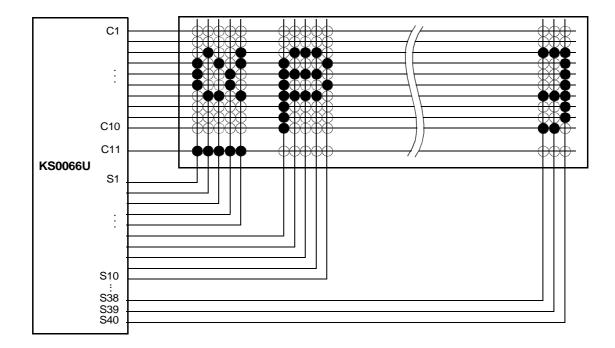

### APPLICATION INFORMATION ACCORDING TO LCD PANEL

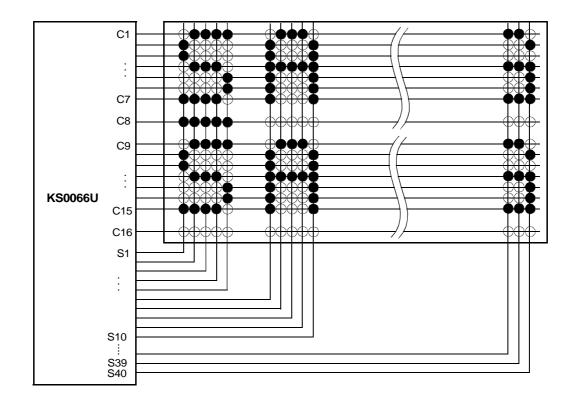

1) LCD Panel: 8 characters ×1-line format (5×7 dots + 1 cursor line, 1/4 bias, 1/8 duty)

2) LCD Panel: 8 characters ×1-line format (5×10 dots + 1cursor line, 1/4 bias, 1/11 duty)

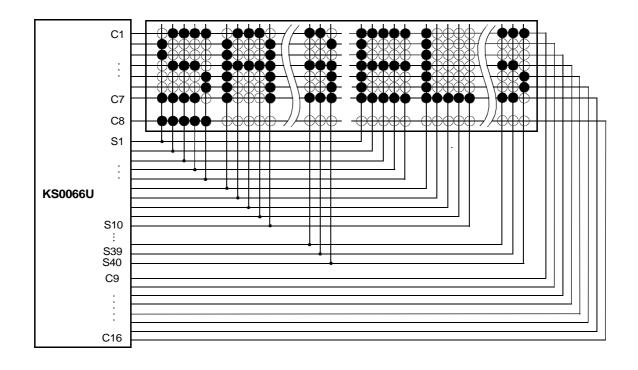

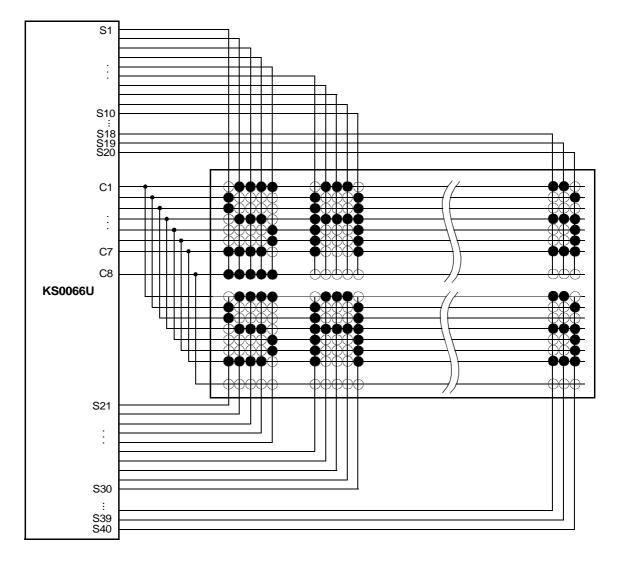

3) LCD Panel: 8 characters ×2 -line format (5×7 dots + line, 1/5 bias, 1/16 duty)

4) LCD Panel: 16 characters ×1-line format (5×7 dots + 1cursor line, 1/5 bias, 1/16 duty)

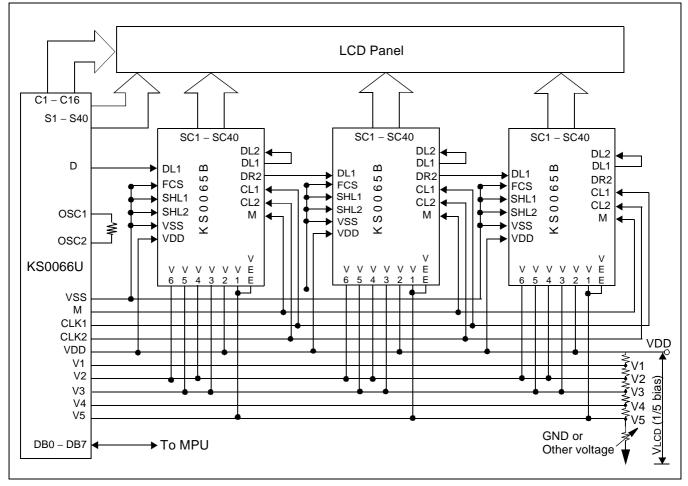

5) LCD Panel: 4 characters ×2-line format (5×7 dots + 1cursor line, 1/4 bias, 1/8 duty)

#### 6) APPLICATION CIRCUIT

NOTE: When KS0065B is externally connected to the KS0066U, you can increase the number of display digits up to 80 characters.

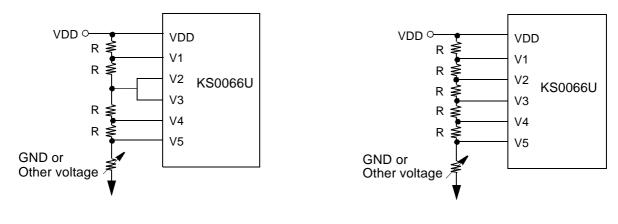

## BIAS VOLTAGE DIVIDE CIRCUIT

1) 1/4 bias, 1/8 or 1/11 duty

SAMSUNG

ELECTRONICS

2) 1/5 bias, 1/16 duty

#### INITIALIZING

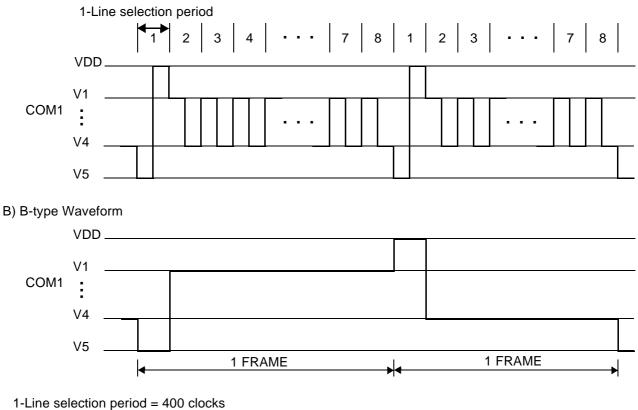

When the power is turned on, KS0066U is initialized automatically by power on reset circuit. During the initialization, the following instructions are executed, and BF (Busy Flag) is kept 'High' (busy state) to the end of initialization.

(1) Display Clear instruction: Write '20H" to all DDRAM
(2) Set Functions instruction: DL = 'High". 8-bit bus mode N = 'Low". 1-line display mode F = 'Low". 5 X 8 font type
(3) Control Display ON/OFF instruction: D = 'Low". Display OFF C = 'Low". Cursor OFF B = 'Low". Blink OFF
(4) Set Entry Mode instruction: I/D = 'High". Increment by 1 SH = 'Low". No entire display shift

#### FRAME FREQUENCY

Programmable Driving Method by the same font mask option: Display waveform A-Type, B-Type

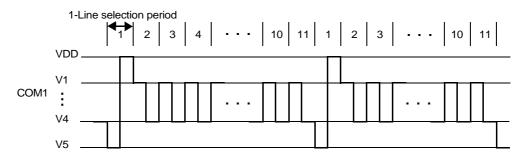

- 1) 1/8 duty cycle
  - A) A-type Waveform

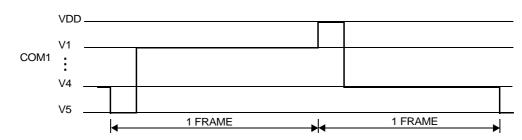

1-Line selection period = 400 clocks 1 Frame =  $400 \times 8 \times 3.7 \ \mu s = 11850 \ \mu s = 11.9 \ ms (1 \ clock=3.7 \ \mu s, \ fosc=270 \ kHz)$ Frame frequency = 1 / 11.9 ms = 84.4 Hz

- 2) 1/11 duty cycle
  - A) A-type Waveform

#### B) B-type Waveform

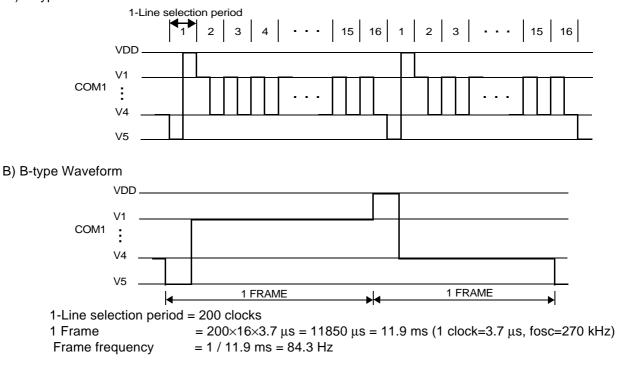

1-Line selection period = 400 clocks

 $\begin{array}{ll} 1 \mbox{ Frame} &= 400 \times 11 \times 3.7 \ \mu s = 16300 \ \mu s = 16.3 \ m s \ (1 \ clock = 3.7 \ \mu s, \ fosc = 270 \ kHz) \\ Frame \ frequency &= 1 \ / \ 16.3 \ m s = 61.4 \ Hz \end{array}$ 

#### 3) 1/16 duty cycle

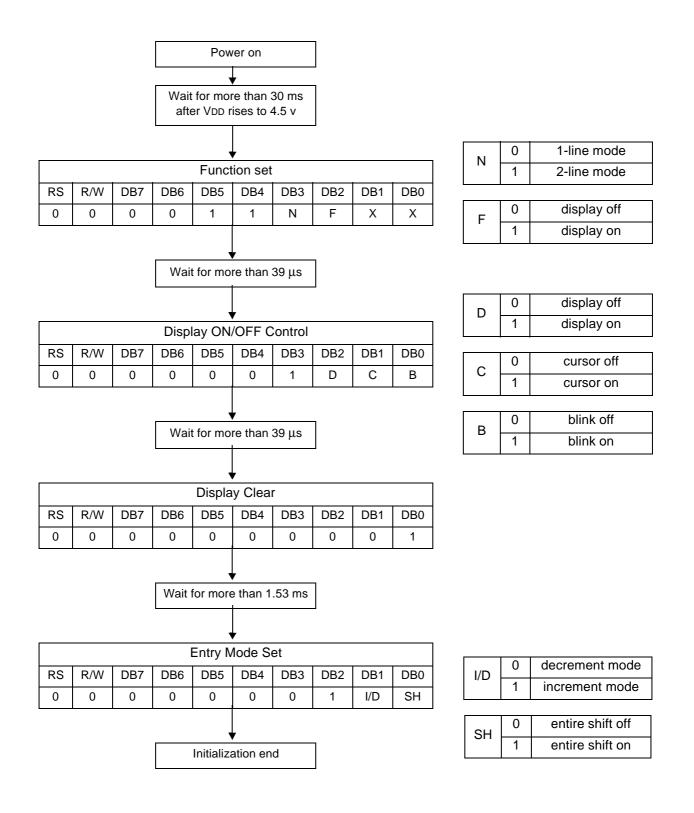

A) A-type Waveform

SAMSUNG ELECTRONICS

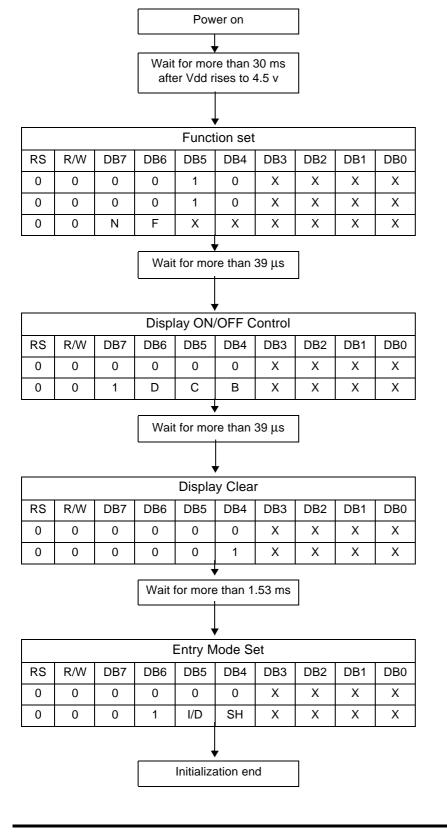

### INITIALIZING BY INSTRUCTION

1) 8-bit interface mode (Condition: fosc = 270KHZ)

SAMSUNG ELECTRONICS

### 2) 4-bit interface mode (Condition: fosc = 270KHZ)

N	0	1-line mode
IN I	1	2-line mode
F	0	display off
•	1	display on

D	0	display off
	1	display on
С	0	cursor off
Ŭ	1	cursor on
В	0	blink off
	1	blink on

I/D	0	decrement mode				
1,0	1	increment mode				
SH	0	entire shift off				

entire shift on
